## **BULLETIN NO. 090819U**

**DATE:** 08/19/09

**PRODUCT: UB90-50/75/100 Boilers** 

**FROM: Technical Service Department** 

TITLE: New Inducer motor/blower assembly

MODELS AFFECTED

UB90-50	UB90-75	UB90-100
00000	000010	0000100

**SITUATION:** We have received reports that in certain installations the inducer motor/blower assembly vibrates causing unacceptable sound levels. The performance of the blower was not affected.

**SOLUTION:** The inducer motor/blower assembly has been redesigned with new components to reduce sound levels associated with vibration.

<u>Production models:</u> We are schedule to begin use of the new inducer assembly starting September 7, 2009.

**In Field Product**: The new inducer assembly will be available as a field replacement kit. The part number for the kit is 2272065. The replacement mounting is physically identical to the original part and requires no retrofit or additional parts. The new inducer can be distinguished by its color. The original housings were light grey and the new housing is black. See photos 1 & 2.

**NOTE:** Be sure to check for other sources of unwanted sound:

- The inducer must not be allowed to support the weight of the PVC vent pipe. The vent pipe must be properly supported with brackets or pipe hangers secured to the structure.
- Check for vibration transmission between the flue pipe where it passes through the boiler jacket. Contact at the jacket penetrations can transmit unwanted sound transmission. See photo 3.
- When penetrating the side wall, always be sure to leave enough room for expansion and contraction of the vent pipe. 1/8 to 1/4 inch clearance around the pipe is recommended with a thin layer of sealant to seal the opening if required. See photo 4.
